

## HLP130 - Tower Assembly/ Construction

### The HLP130 is a crane specifically designed with all elements of Offshore Energy in mind.

HLP engineers provide simple and clear solutions to our clients needs. Our team can help you turn any quayside into a highly efficient assembly/construction campaign.

In the HLP130 layout above, a number of 'tower assembly locations' are spaced around the centrally located HLP130. Any location is easily within reach at any point, transforming a traditionally linear process, into a modern slick process which allows multiple assets to progress at once. Once a tower is completed, it is lifted in its entirety, from any location, and is transferred to a dedicate 'Offloading location' directly on the quayside for ease of access (or straight on to your floating foundation) – all off which is conducted with a single crane – the HLP130.
